Final Project Summary

       For this final project, I created a portfolio showcasing a few of my video game designs and engineering projects. I hope to register this website under my own domain name in the future, in order to have a public portfolio that I can show to family, friends, and employers.

The Extras that I used in this website are as follows:

1. Transitions: I created three transition animations called Fadedown, Fadeup, and Fadein. Fadedown and Fadeup involve changing the position and opacity of a specified element over a span of one second. Fadein is similar, but it only affects the opacity. I used these transitions for several bodies of text throughout my website.
2. "Fake Loader" code snippet: I used an example from the W3Schools website to create a fake page loader, which essentially shows a loading screen for two seconds before the user can access certain pages.

3. jInvertScroll plugin: This plugin causes a page to appear as if it is being scrolled sideways, even though the user is scrolling in an up-down motion.
